To build a resilient pharmaceutical supply chain, we need a coherent European pharmaceutical strategy to:

- ✓ Restore and **secure the production of the critical and strategic pharmaceutical** components in Europe
- ✓ Ensure **regulatory flexibility** (e.g. fast track approvals), to prevent future shortages due to unforeseen events or surges in demand
- ✓ Support **investments** to boost innovation, ensure European industry's competitiveness globally, whilst maintaining high quality, safety and environmental standards
- ✓ Coordinate at European level a **list of essential medicines** that need to be available at all times and monitor any risks of spikes or shortages

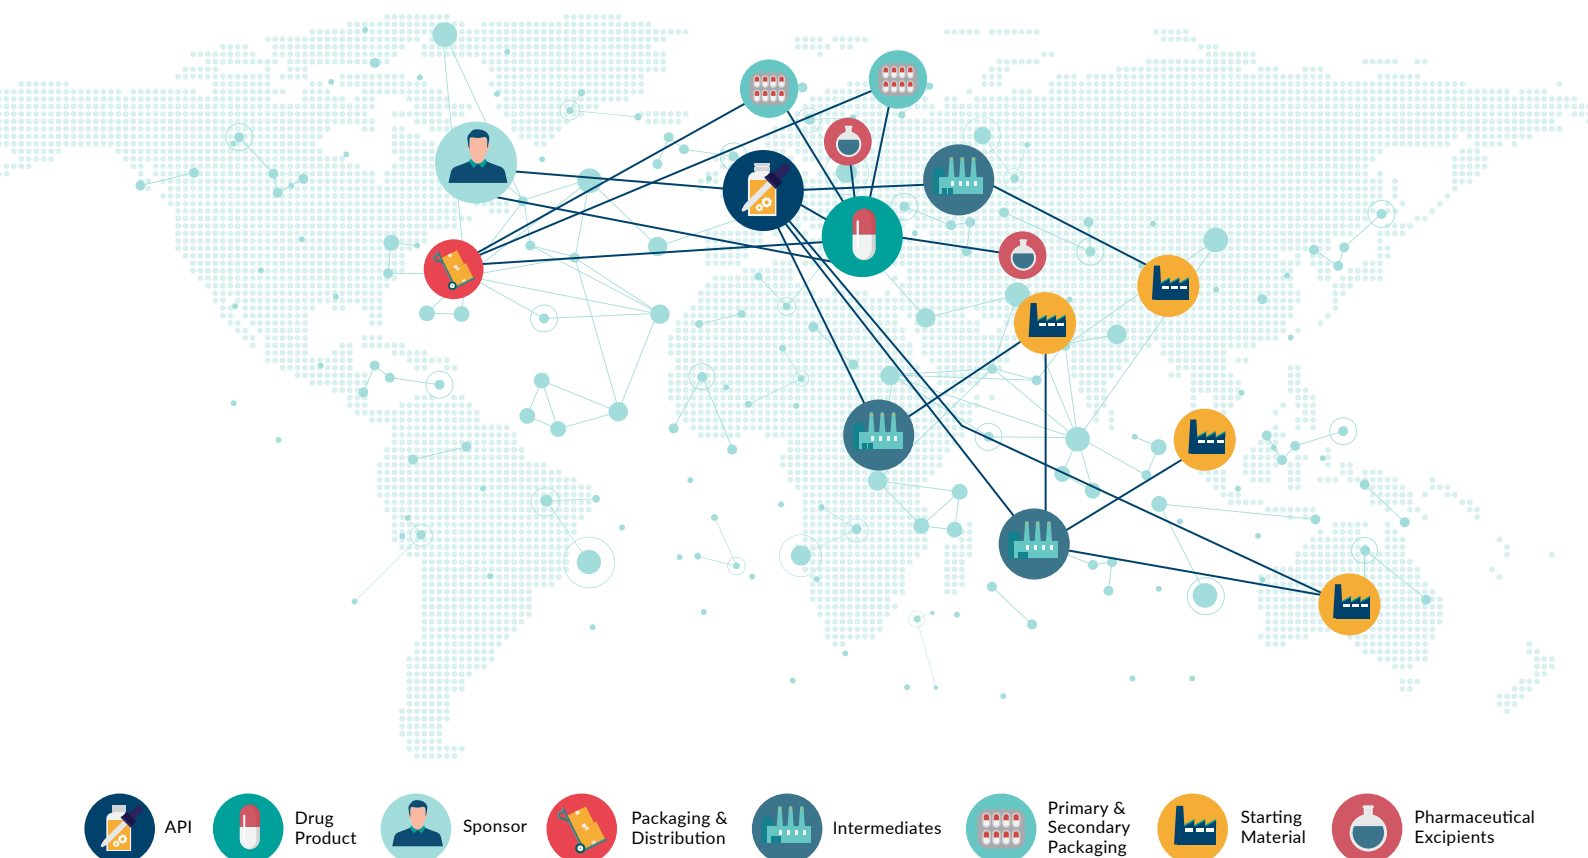

Our European member companies have production facilities, critical know-how, a highly skilled manpower and the highest quality and environmental standards.

We will actively contribute to building a resilient and sustainable European pharmaceutical supply chain.

Producing a single API is a complex process requiring many steps and raw materials

The API and excipient supply chains are global as illustrated by this example:
